Question 1 [10 marks]

(i) State the definition of two mutually exclusive events. For a finite collection of mutually exclusive events $E_1, E_2, \ldots, E_n$, what is the relationship between $P(\cup_{i=1}^n E_i)$ and $\sum_{i=1}^n P(E_i)$? Justify your answer. [3]

(iii) the second ball is magenta; [1]

(iv) the second ball is magenta, given that the first is magenta. (Hint: $\sum_{i=1}^n i^2 = \frac{n(n+1)(2n+1)}{6}$ and $\sum_{i=1}^n i = \frac{n(n+1)}{2}$) [3]

Question 2 [10 marks]

In a game show, you are asked to choose one of the three doors. One conceals a new car and two conceal goats. You choose, but your chosen door is not opened immediately. Instead the presenter opens another door, which reveals a goat. He approaches you and asks "would you like an opportunity to change your choice to the third door, which is unopened and unchosen so far?". Let p be the conditional probability that the third door conceals the car. The presenter's protocol is:

(i) he is determined to show you a goat, with a choice of two, he picks one at random. Show $p = \frac{2}{3}$. [3]

(ii) he is determined to show you a goat; with a choice of two goats (named B and N) he shows you B with probability b. Show that, given you see b, the probability $p = 1/(1+b)$. [2]

(iii) he opens a door chosen at random irrespective of what lies behind. Show $p = \frac{1}{2}$. [2]

(iv) Show that, for $\alpha \in [\frac{1}{2}, \frac{2}{3}]$, there exists a protocol such that $p = \alpha$. Are you well advised to change your choice to the third door? [3]

Question 3 [10 marks]

(iii) Calculate the conditional expected value $E(Y|Y < 4)$ and the conditional variance $Var(Y|Y < 4)$. [2]

(iv) Find an expression for $P(Y < u|Y > 1 \text{ and } Y < 4)$. [2]

Question 4 [10 marks]

A Beacon Tower was built at the top of the mountain to give alarm by smoke in the ancient China. If invading enemy forces were spotted during the daytime, the patrol in one tower would burn wolf manure immediately. The smoke (also known as wolf smoke) could then be visible to the next tower, where another wolf smoke would be set. Information of an invasion was therefore delivered from one tower to the next.

Alpha1, Beta2, Charlie3 and Delta4 are four beacon towers built strategically such that none of any three towers lie in a straight line. The visibility between any two towers can be blocked by thick fog with a probability p. Fog between each pair take place independently. If any of the tower starts the wolf smoke, it can only be seen by another with no fog in between. If Alpha1 spots an invasion, what is the probability that

(i) Delta4 is aware of the invasion given fog between Delta4 and Alpha1. [3]

(ii) Delta4 is aware of the invasion given fog between Beta2 and Charlie3. [2]

(iii) Delta4 is aware of the invasion given fog between Beta2 and Alpha1. [2]

(iii) Delta4 is aware of the invasion. [3]
